

service is creating it; dependency itself

```

class UserService {
    UserMongoRepository repo;

    UserServiceConstructor() {
        repo = new UserMongoRepository();
    }
}
  
```

Service ----> Repo

```

class UserService {
    UserRepositoryInterface repo;

    UserServiceConstructor(UserRepositoryInterface _repo) {
        repo = _repo;
    }
}
  
```

service is not creating the dependency itself

It is expecting some external entity to create the obj of it's dependency and pass to it

```

main() {
    UserService s = new UserService( new UserMySQLRepository() )
}
  
```
